(54) Title: A DEVICE FOR JOINING PANELS

(57) Abstract: A joining member (10) for bridging a gap between a first (50a) and at least one second panel (50b) wherein the joining member (10) comprises a flange member (11), one or more extension members (12) extending from the flange member (11), and at least one retaining member (21 or 22) connected to the extension member (12). The retaining member (21 or 22) is moveable relative to the extension member (12) between a first configuration and a second configuration, the retaining member (12) in the second configuration being insertable in use through the gap between the first and at the least one second panel. When inserted through the gap, the retaining member (21 or 22) is engageable with a rear surface (51), relative to the flange member, of each panel and the flange member substantially bridges the gap between the first and second panels.
